EXAMINER'S AMENDMENT

1. An examiner's amendment to the record appears below. Should the changes and/or additions be unacceptable to applicant, an amendment may be filed as provided by 37 CFR 1.312. To ensure consideration of such an amendment, it **MUST** be submitted no later than the payment of the issue fee.

Authorization for this examiner's amendment was given in a telephone interview with George Kaplan on March 20, 2008.

The application has been amended as follows:

Claim 17 has been amended to recite:

-- A computer comprising internal memory and a computer program, and a computer program is directly loaded into the internal memory of the computer and comprises software code parts to execute the steps of claim 14 when the program is run on the computer. --

Claim 18 has been amended to recite:

-- An apparatus for preventing tipping of a vehicle, comprising:

a computer;

a computer program provided at least partly via a network, directly loaded into internal memory of the computer and comprising software code parts when the program is run on the computer to execute the steps of a method for controlling the stability of the vehicle against tipping;

the vehicle comprising a chassis (1);

at least two mutually separated wheels (3) arranged on a first side (2) of the chassis and two mutually separated wheels (5) on the opposite, second side (4) of the chassis, with the wheels arranged to support the chassis when resting on the ground;

the wheels on the first side rotatable about axes substantially fixed in position in the vertical direction relative to the chassis and the wheels on the second side arranged on a frame part (6) pivotably arranged relative to the chassis about a substantially central longitudinal axis (8) running between the first and second sides of the vehicle to create a stability area for the vehicle in the shape of a triangle in the horizontal plane;

the program adapted to determine the position of the vehicle's tipping point (T) in relation to the stability area and thus the vehicle's stability and fix the frame part relative to the chassis by signaling a fixing means when the result of the determination calls for an increase of the vehicle's stability area to be defined by said wheels;

wherein when the determination results in that the vehicle's tipping point reaches a boundary area (19) of the stability triangle, a resistive force is gradually increased that opposes a pivoting of the frame part relative to the chassis about said axis on increasing distance of the tipping point from the centre of the triangle to gradually increase the stability area; and,

when the tipping point reaches a predetermined boundary, the frame part is completely fixed relative to the chassis and creates a stability area defined by said wheels. --

Claim 19 has been amended to recite:

-- Computer readable memory with a registered program thereon, which is designed to cause a computer to execute the steps according to claim 14. --
